

Seamless integration with weighbridge and production control systems

Safe Computing delivers seamless integration with weighbridge and production control systems from industry leaders such as Buhler, Avery and Precia-Molen.

This ensures there is no need to re-key data as full control is assured relating to stock arriving on-site or finished goods leaving site whether using own fleet or supplier/customer transport.

It also means that exact figures will be recorded within the system as provided by the production control system related to usage, wastage, re-work etc.

The system allows for control over Proof of Delivery, Collections, Returns, Split loads.

Pallets are managed closely both on-site and at customer site so that it is possible to bill customers for pallets not returned by pre-agreed time.

Residuals within a tanker are also fully catered for providing the option to blow out to the same item, blow out to a different item or leave in the tanker and convert to a new product subsequently added to the tanker.

Integration is also provided to route planning software such as DPS Logix.
